TITLE: New measurements of U^{235} fission neutron age in hydrogen-containing substances

PERIODICAL: Atomnaya energiya, v. 12, no. 2, 1962, 151 - 152

TEXT: The distributions of 1.46-ev neutrons as a result of slowing down U^{235} fission neutrons in H_2O and $C_{15}H_{16}$ were measured for two source thicknesses: 0.3 and 1.8 mm. An indium detector was placed in a stainless-steel tank in the thermal column of the reactor for measuring the age of neutrons slowed down in $C_{15}H_{16}$. A highly enriched uranium metal target converting fast fission neutrons into thermal neutrons was the neutron source. The neutron distribution was determined by two targets, one at the end of a 150 mm long aluminum tube, the other 120 mm from the bottom of the tank for control measurements, which showed that the aluminum tube did not distort distribution. On the outside of the tank bottom another target was

Card 1/2

New measurements ...

placed. The neutron distributions were measured and curves $\log N = f(R)$ were plotted in the R-range 0 - 50 cm; $\log N$ fell almost linearly with increasing R. The following results were obtained:

Moderator	τ_{measured}		τ_{calcul}
	$\delta = 1.8 \text{ mm}$	$\delta = 0.3 \text{ mm}$	
H ₂ O	$(31.1 \pm 0.9) \text{ cm}^2$	$(27.3 \pm 1.0) \text{ cm}^2$	$(26.0 \pm 0.5) \text{ cm}^2$
C ₁₅ H ₁₆	$(45.9 \pm 1.6) \text{ cm}^2$	$(44.9 \pm 1.8) \text{ cm}^2$	44.4 cm^2

For zero thickness of source, $\tau(1.46 \text{ ev}) = (27.3 \pm 0.9) \text{ cm}^2$. There are 1 figure, 1 table, and 4 references: 3 Soviet and 1 non-Soviet. The reference to the English-language publication reads as follows: D. Lombard, C. Blanchard, Nucl. Sci. and Engng., 7, 5, 448, 1960.

AUTHOR: Yurova, L. N.; Polyakov, A. A.; Ignatov, A. A.

TITLE: The age of fission neutrons in water

SOURCE: Moscow. Inzh.-fiz. institut. Nekotoryye voprosy* inzhenernoy fiziki
(Some problems in engineering physics), no. 4, 1963, 43-46

TOPIC TAGS: nuclear reactor, neutron, fission neutron, neutron age, neutron
absorption

ABSTRACT: The authors note that recent experiments to determine the age of neutrons in water indicate satisfactory agreement between the value of 26.0 ± 0.5 cm² given by Kh. Gol'dshteyn, P. Teveyfel and D. Foster (Trudy* Vtoroy mezhdunarodnoy konferentsii po mirnomu ispol'zovaniyu atomnoy energii Geneva, 1958). Izbr. dokl. inostrannykh uchenykh. T.2 - "Neutronnaya fizika". M., Atomizdat, 1959, str. 689) and the new values of 27.3 ± 1.0 and 27.3 ± 0.9 cm² given by L. N. Yurova, A. A. Polyakov, and A. A. Ignatov (Novyye izmereniya vozrasta neytronov v vode. "Atomnaya energiya", 10, no. 2, 1961) and by Lombard and Blanchard (Nucl. Sci. Engng, 7, 5, 1960), respectively. It is pointed out that the rated and experimental data converge, if the dependence of the spatial distribution of the

Card 1/3

ACCESSION NR: AT4018976

slow neutrons on the effect of the absorption of these neutrons in the source is considered during the experiment. However, the last two papers mentioned contain no calculations confirming the existence of this dependence. In the present paper, an estimation of this effect is given on the basis of a concrete example. An infinite laminar source, with thickness d , is considered. The material of the source is U-235. The flow distribution from the right-hand side of the source ($x \geq 0$) is found. All the neutrons are broken down into three energy groups and the assumption is introduced that the laminar source absolutely does not absorb neutrons with energy greater than 1234 ev. An expression for the spatial distribution of the stream is derived, after which the neutron age with different source thicknesses can be easily computed. For a plain (flat) case, when

$$\tau = \frac{1}{2} \cdot \frac{\int_0^{\infty} x^2 \phi(x) dx}{\int_0^{\infty} \phi(x) dx}$$

the following are the results:

when $d = 0$
when $d = 0.18$ cm

$\tau = 26.9$ cm²
 $\tau = 31.8$ cm²

Card 2/3

ACCESSION NR: AT4018976

The authors note, in conclusion, that absorption of slowed neutrons in the source may have a substantial influence on the spatial distribution, with the latter, in turn, influencing the value of the neutron age in the medium. Orig. art. has: 12 formulas.

TITLE: Neutron age in the fission of U-235 in monoisopropyl diphenyl and in iron-diphenyl and aluminum-diphenyl mixtures

SOURCE: 1 Atomnaya energiya, v. 17, no. 4, 1964, 303-304

TOPIC TAGS: neutron age, uranium fission, organic moderator, homogeneous moderator, inhomogeneous moderator, neutron density distribution, diffusion length

ABSTRACT: The work was done in a thermal column of the heavy water reactor of AN SSSR in 1960 as part of a program of research on the moderating and diffusion properties of hydrogen-containing media. The age of neutrons produced by moderating U²³⁵ fission neutrons in monoisopropyl diphenyl (C₁₅H₁₆) was measured with an indium detector. The moderated-neutron distribution near the source was measured with

Card 1/3

L 13219-65

ACCESSION NR: AP4047418

a target consisting of indium foils. The neutron density distributions along the axis of the stainless steel tank (41 cm diameter 110 cm long) placed in the thermal column of the reactor were measured for the following cases: a) "small" (pointlike) source, target thickness 1.8 mm, diameter 20 mm; b) "small" (pointlike) source, target thickness 0.3 mm, c) "large" source, target thickness 0.3 mm, diameter 50 mm. The plotted distribution of the neutrons with energy 1.46 eV produced after moderation was used to calculate the neutron age. The value obtained experimentally was $42.7 \pm 1.8 \text{ cm}^2$, which agrees well with the 43.4 cm^2 calculated by V. P. Kochergin and V. V. Orlov (Atomnaya energiya v. 6, 34, 1959), and with 43.4 cm^2 obtained by multi-group computer calculations made at the Fiziko-energeticheskii institut. The thermal-neutron density distribution yielded for the diffusion length of the neutrons a value $3.71 \pm 0.03 \text{ cm}$. An analogous procedure was used to measure the age of neutrons moderated in mixtures of diphenyl and iron and diphenyl and aluminum. For the diphenyl-iron (25% by volume) mixture the age was found to be

Card 2/3

L 13219-65

ACCESSION NR: AP4047418

75.0 \pm 4.4 cm², while for diphenyl-aluminum (20% volume) -- 87.8 \pm 2.3 cm². This compares with 65.6 and 71.7 cm² obtained by Kocher-gin and Orlov and with 68.5 and 79.9 cm² obtained by the multi-group calculation. The corresponding diffusion lengths are 2.63 \pm 0.04 and 11.19 \pm 0.82 cm. The greater deviation in the case of moderator mixtures indicates that the heterogeneity of the medium must be taken into account in theoretical studies of moderation of neutrons in mixtures of hydrogen-containing compounds and metals. SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 6, 1965, 114-120

TOPIC TAGS: signal noise separation, signal detection

ABSTRACT: In an earlier authors' work [Izv. AN SSSR, Tekhnicheskaya kibernetika, 1965, no. 1), a method was suggested for determining the weight function of an optimal filter from a solution of an Euler differential equation; the latter belonged with a variational problem that had properly formulated boundary conditions for the case when the desirable signal $m(t)$ and noise $n(t)$ were described by differential equations which set the connections with the initial white noise $V_m(t)$ and $V_n(t)$. The present article applies the above method to solving the problem of optimal filtration

Card 1/2

2

L 15050-66

ACC NR: AP6002154

of the signal $q(t) = \sum_{i=1}^N U_i q_i(t)$ that has random coefficients U_i and noise $n(t)$ as a background; the filtration is described by the differential equation $w_n(p)n(t) = V_n(t)$, where $w_n(p) = \sum_{i=0}^s c_i p^i$, $p = \frac{d}{dt}$, c_i are generally variable coefficients. The desirable signal and noise are not correlated. The method is easily generalized to cover problems with specified-shape input signals; in the unbiased-estimator problem, the Euler differential equation for the weight function ξ of the filter part being optimized degenerates into an algebraic equation. In the biased-estimator problem, the form of solution of the integral equation for ξ does not differ from that of the nonbiased-estimator solution. No singular cases arise in solving the optimum-filtration problem by the above method. Orig. art. has: 60 formulas.

TITLE: Solution of the optimal filtration problem for random signals whose properties are varying at given instants

SOURCE: Avtomatika i telemekhanika, no. 3, 1966, 40-47

TOPIC TAGS: filtration, optimal filtration, optimal filter, Euler equation, random signal

ABSTRACT: A method is presented for determining the optimal filter for input signals consisting of the useful signal $m(\tau)$ and of the noise $n(\tau)$ which are random functions of time and whose statistical characteristics on the given intervals of time (t_0, t_1) , $(t_1, t_2) \dots (t_{N-1}, t_N)$ are different. These characteristics are described on every interval by given differential equations. The problem is reduced to determining the weighting function of the optimal filter in the form

$$g(t, \tau) = \sum_{k=1}^N g_k(t, \tau). \quad (1)$$

under the assumption that weighting function $g_k(t, \tau)$ is nonzero on every interval

Card 1/2

UDC: 62-505

L 20749-66

ACC NR: AP6010279

of the sequence of intervals. An estimate $m^*(t)$ of the useful signal at the output of the filter is derived and the filtration error $\epsilon(t)$ is established. An expression for the variance $D_\epsilon(t)$ of the filtration error is formed, and the weighting function minimizing the variance $D_\epsilon(t)$ is sought. Determining the optimal weighting functions is reduced to the solution of a system of Euler's differential equations. Solutions of these equations contain a certain number of arbitrary constants as well as a certain number of parameters; a complete system of algebraic equations is derived for determining these parameters. The method is illustrated by an example. Orig. art. has: 40 formulas. [LK]

TITLE: Influence of the method of unloading the side screen of a fast breeder reactor on its doubling time

SOURCE: ¹⁹ Moscow. Inzhenerno-fizicheskiy institut. Nekotoryye voprosy fiziki i tekhniki yadernykh reaktorov (Some problems in the physics and engineering of nuclear reactors). Moscow, Atomizdat, 1965, 85-104

TOPIC TAGS: breeder reactor, nuclear reactor characteristic, nuclear material processing, uranium, plutonium

ABSTRACT: By calculating theoretically the amount of secondary fuel produced in the screen of a breeder reactor always present in the reactor between the loading-unloading cycles (defined as the 'frozen-in' fuel), the authors show that the doubling period of the total amount of fissioning material in the reactor depends strongly on the

Card 1/2

L 25440-66

ACC NR: AT6005817

sequence with which the screen breeder zone is replaced with fresh stacks of raw material. Three methods of fuel replacement are considered: 1) Moving screen, in which the innermost raw uranium blocks, in which plutonium is formed first, are removed first and the outer blocks are continuously moved inward. 2) Stationary screen, where each block is replaced by a fresh one after a prescribed norm of plutonium is produced in it, regardless of its position in the reactor and without rearrangement of the blocks. 3) Two-zone moving screen, which is essentially a combination of the first two methods. The over-all rate of breeding and the breeding in the individual concentric layers of the reactor are calculated for the first method and expressions are obtained for the distribution of the plutonium over the reactor in the other two. The influence of the amount of frozen-in plutonium on the doubling period, defined as the time elapsed before the newly produced excess fuel equals the total amount of fuel in the cycle, is determined and an equation is derived to establish the reloading method giving the best results. It is shown that the method of reloading becomes important the larger the norm of accumulation of plutonium in the raw uranium and the smaller the size of the active zone. Orig. art. has: 3 figures and 45 formulas.

TITLE: Asymptotic stability of optimal filters

SOURCE: Avtomatika i telemekhanika, no. 6, 1966, 50-60

TOPIC TAGS: optimal automatic control, control system stability, filter circuit, function analysis

ABSTRACT: The problem of the characteristics of an optimal filter weighting function $g(t, \tau)$ when $t \rightarrow \infty$ is considered. The fundamental assumption postulated by the authors consists in defining the useful signal $m(\tau)$ and the noise $n(\tau)$ by differential equations which link them with "white noise." It is demonstrated that regardless of the stability of the solutions of these differential equations, an optimal filter at $t \rightarrow \infty$ is stationary and asymptotically stable. Formulas are derived for the determination of the optimal weighting function for this particular case. A maximum limiting value for the error spread is found. An analysis is given for the problem of filter stability in cases in which the required conversion of the useful signal corre-

TOPIC TAGS: transport equation, neutron diffusion, nuclear reactor, reactor neutron flux, neutron spectrum

ABSTRACT: The method of subgroups for solving the neutron transport equation with consideration of the energy dependence is discussed for the case when the structure of the neutron spectrum depends significantly on diffusion. Algorithms are given for calculating the distribution of subgroups in adjacent media, one of which has a resonance structure of the total cross section $\Sigma_t(u)$. The portion of the cross section curve containing the resonances where the average resonance parameters are approximately constant is separated out. The neutrons in the interval can be distributed into subgroups corresponding to the distribution of the magnitude of the total cross section. The diffusion equation for neutrons of subgroup k of the

resonance medium is expressed in the form

$$\left. \begin{aligned} \frac{1}{r^2} \frac{dJ^k(r)}{dr} &= F^k(r) - \Sigma^k \Phi^k(r); \\ J^k(r) &= -r^2 D^k \frac{d\Phi^k(r)}{dr}, \end{aligned} \right\}$$

where the superscript k indicates quantities relating to the subgroup k, J is the neutron current, Φ is the neutron flux, F is the subgroup sources including neutrons scattered into it and remaining in it, D is the diffusion constant, and α is a parameter determined by the system geometry. Application of the method of subgroups to the region of high energies is also discussed. Orig. art. has: 15 equations.

TITLE: A method for calculating relaxation length of an asymptotic spectrum

SOURCE: Moscow. Inzhenerno-fizicheskiy institut. Inzhenerno-fizicheskiye voprosy yadernykh reaktorov (Problems of nuclear reactor engineering and physics); sbornik statey. Moscow, Atomizdat, 1966, 96-106

TOPIC TAGS: breeder reactor, neutron spectrum, asymptotic solution, *GAS KINETIC EQUATION*

ABSTRACT: A direct method is discussed for calculating the relaxation length and asymptotic spectra in weakly-breeding media by using multi-group P_n -approximations, including all the singularities of the scattering characteristic curve. The gas kinetic equation of neutron balance in a plane geometry is given by

$$\begin{aligned} \mu \frac{\partial \psi(x, u, \mu)}{\partial x} + \Sigma_t(u) \psi(x, u, \mu) = \int d\Omega' \int du' \psi(x, u', \mu') \Sigma_s \times \\ \times (u', u, \mu_0) + \frac{1}{4\pi} \int d\Omega' \int du' \psi(x, u', \mu') \Sigma_{in}(u', u) + \\ + \frac{\kappa(u)}{4\pi} \int d\Omega' \int du' \psi(x, u', \mu') \nu_f(u') \Sigma_f(u'). \end{aligned} \quad (1)$$

Card 1/2

ACC NR: AT7005809

The P_N -approximation is given by the expansion

$$A(u, \mu) \approx \sum_{l'=0}^N \frac{2l'+1}{2} A_{l'}(u) P_{l'}(\mu); \quad (2)$$

$$\sum_{\lambda} A(u', u, \mu) \approx \sum_{\lambda} A(u', u) \sum_{l=0}^N \frac{2l+1}{2} P_l(\mu) P_l(\mu_0, \lambda(V)).$$

which, when substituted in equation (1), leads to the following set of equations for the elements $\{A_n^k\}$

$$\lambda(L) A_n^k = \sum_{l,l'} B_{ll'}^k(L) A_l^k. \quad (3)$$

These equations are then solved on the assumption that the set possesses a simple, positive, small modulus characteristic number to which corresponds a characteristic vector selected from the positive elements $\{A_n^k\}$. A separation-of-variables technique is used, and the characteristic numbers $\lambda(L)$ are calculated using a step-by-step iteration method. The domain where asymptotic assumptions fail is also investigated. The authors express their gratitude to A. I. Shabalov for his help in performing the calculations. Orig. art. has: 18 equations and 1 figure.

TITLE: Automation and Mechanization of Control of Mass-Production
Components (Avtomatizatsiya i mekhanizatsiya kontrolya
massovyykh detaley)

PERIODICAL: Sbornik: Opyt proizvoditel'nosti truda, Chelyabinsk,
Knigoizdat, 1956, pp.252-272.

ABSTRACT: Installations developed or applied at the Chelyabinsk
Tractor Plant (ChTZ) are described: automatic machines
with electric contact transmitters for the control of
elasticity and of clearance of the lock of piston rings,
mechanized light-signal devices for multimeter control of
pistons (13 dimensions) and valves (9 and 7 dimensions),
a device for controlling the thickness of nonmagnetic
coatings by the method of its contact-breaking magnet
which provides a reliable check up of galvanic and varnish

Automation and Mechanization of Control of Mass Production (Cont.) 112-1-1241

coats up to 0.003 mm thick with an accuracy of 1 to 2 μ . Pneumatic control and measuring instruments are widely used for the control of dimensions executed according to the 1-st and 2-nd classes of precision. A hydroplastic equipment for an accurate and rapid basing of components for testing is described. The necessity of automation of the control of threaded articles is emphasized since for their calibration with gages, 8 to 15 times more time is consumed than in producing threads by knurling. A device for controlling external threads is described. A schematic draft of a micro-testing indicator for the inspection of discontinuous surfaces in the process of polishing is presented.

Machine-aided design and construction of machine tools. 1979. 519 p. 12,000 copies printed.

The book is intended for production engineers and technicians in machine building. The material presented in this book is suitable for use in the design and construction of machine tools. The book is divided into two parts. The first part is devoted to the design and construction of machine tools. The second part is devoted to the construction of machine tools. The book is written in a clear and concise style. It contains many illustrations and diagrams. The book is a valuable reference for production engineers and technicians in machine building.

Ch

The wettability of thin layers of metals prepared by evaporation in vacuum. D. V. Ignatov. *J. Tech. Phys.* (U. S. S. R.) 9, 2166-64 (1939).—Thin layers of Ni were deposited in vacuum on gold or glass and then flooded with paraffin oil. A drop of water was placed on the oil layer and the contact angle θ between Ni , H_2O and oil observed. θ reaches a const. value in, e. g., 10 min. for a layer of Ni 0.6 μ thick, and 70 min. for 3 μ . This value of θ is independent of the underlayer if the film of Ni is more than 20 μ thick; it is $\theta = 180^\circ$. If the metal surface is left under oil for several hrs. the rate of spreading of H_2O drops is reduced. Thick films of Al, Zn, Fe, Ag and Au also give $\theta = 180^\circ$. If the air is admitted to the metal film before it is covered with oil, the final θ is $70-80^\circ$ for Ni and Fe, $80-100^\circ$ for Zn and Al, and $120-130^\circ$ for Ag and Au. A change of θ can be detected when the air pressure is 10^{-5} mm. Hg or more. Oil drops do not spread on oxidized films of Zn or Al when they are wetted by water.

Electrographic study of the oxidation of copper at high temperatures. P. D. Dankov and D. V. Ignatov (Inst. Phys. Chem., Acad. Sci. U.S.S.R., Moscow). *Izv. Akad. Nauk S.S.R., Otd. Khim. Nauk* 1960, 234-7. —The oxide film formed on heating of massive Cu differs essentially from the oxide observed by Bound and Richards (C.I. 33, 45674) on thin evap. films. In electron diffraction, the oxide film formed in 25-min. heating in air, at 200°, of a 3-mm. electrolytic Cu plate, showed lines of both cuprite, Cu_2O , and of tenorite, CuO . However, lines of the latter were very much weaker in samples heated at the same temp. of 200° both for shorter (5 or 10 min.) and for longer times (50 min.); under these conditions, many of the CuO lines dropped out altogether. And, after 150 min., not a single line of CuO was left. Evidently, the CuO phase in the outer layer of the film reaches a max. at about 25 min. heating. These observations indicate that the growth of the oxide film is detd. by diffusion of Cu ions from the metal to the adhered layer of oxygen. Schematically, the outer thin layer of metal contains a small amt. of dissolved O_2 , increasing toward the inner boundary of the Cu_2O film, where the Cu content falls sharply to 66.6 at. %. Throughout this film, the amt. of O_2 dissolved in Cu_2O increases rapidly in the direction of the boundary between the inner Cu_2O and the outermost CuO film, where the Cu again drops sharply to 80 at. %

Within the CuO layer, the O content again increases toward the metal-gas boundary. The cuprite lattice being particularly prone to deviations from stoichiometry in the sense of excess of metal (or deficit of O), the O concn. gradient in the Cu_2O layer is marked, and favors diffusion of Cu ions from the inside to the outside. The build up of the outer CuO film will reach a sufficient degree of lattice perfection only after a definite length of heating, and only then will CuO lines become detectable in electron diffraction. Once a regular outer CuO film has been formed, Cu ions will accumulate at the Cu_2O / CuO boundary, and, penetrating ever deeper into the CuO layer, will gradually transform it into Cu_2O . N. Thom

TITLE: An Electronographic Investigation of Phase Changes in Thin Films of Metals and Oxides. (Elektronograficheskoye issledovaniye fazovykh izmeneniy v tonkikh plenkakh metallov i okislov).

PERIODICAL: Kristallografiya, 1957, Vol.2, Nr 4, pp.484-488 (USSR).

ABSTRACT: Thin films of Al, Al-Fe alloys and also $\text{NiO-Cr}_2\text{O}_3$ and $\text{NiO-Al}_2\text{O}_3$ oxides were heated in air and the resulting changes were followed electronographically. The metal films were formed by vacuum evaporation to a thickness of 400-500 Å; in the case of the alloy two sources were used simultaneously. The films were formed on mica, removed in water and transferred to a microscope grid on which the oxidation was carried out. For the mixed oxides further layers were deposited by evaporation. The thicknesses were calculated to give the stoichiometric compositions NiAl_2O_4 and NiCr_2O_4 . An Al film was heated in air at 300 C for 5 hours and at 400, 450, 500, 600 and 700 C for 10 minutes. At 300 there is significant γ' - Al_2O_3 which persists with Al up to 600. At 600 there is a transition to γ - Al_2O_3 which is stable to 1300. After 5 hours heating at 1300 the latter compound transforms to α - Al_2O_3 . In

TITLE: Investigation Into Diffusion Processes of Iron and Chromium in α - Al_2O_3 , α - Cr_2O_3 , NiCr_2O_4 and NiAl_2O_4 Oxides

PERIODICAL: V sb.: Metallurgiya i metallovedeniye, Moscow, AS USSR, 1958, pp 326-330

ABSTRACT: Tablets were pressed of α - Al_2O_3 , α - Cr_2O_3 oxides and mixtures in a stoichiometric relation for spinels ($\text{NiO}/\text{Cr}_2\text{O}_3 = 1$ and $\text{NiO}/\text{Al}_2\text{O}_3 = 1$). The tablets were subsequently sintered. The active layer of 0.1 to 1 μ thickness was applied by the method of evaporation in a vacuum. The thickness of the layer was determined from the growth of weight. Diffusion annealing was carried out in quartz tubes or ampoules in a vacuum of 10^{-2} - 10^{-3} mm Hg for Cr at 1,100°, 1,000°, 900°C and for Fe at 1,200°, 1,100° and 1,000°C during 25 - 200 hours. The distribution of concentrations was investigated by removing the layers. All experimental lg D points (D is the coefficient of diffusion) depending on the inverse temperature 1/T can be satisfactorily arranged on a straight line. The authors point to the relative character of results obtained, due to the effect of surface

IGNATOV D. V.

89-3-17/30

AUTHORS: Belokurova, I. N. , Ignatov, D. V.

TITLE: Investigation of the Diffusion Processes of Iron and Chromium in the Spinels NiCr_2O_4 and NiAl_2O_4 by the Aid of Fe^{59} and Cr^{51} (Issledovanie protsessov diffuzii zheleza i khroma v shpinelyakh NiCr_2O_4 i NiAl_2O_4 s pomoshch'yu Fe^{59} i Cr^{51})

PERIODICAL: Atomnaya Energiya, 1958, Vol. 4, Nr 3, pp. 301-302 (USSR)

ABSTRACT: The samples of spinels were made from powdery NiO , Cr_2O_3 , Al_2O_3 in the stoichiometrical ratios $\text{NiO} : \text{Cr}_2\text{O}_3 = 1$ and $\text{NiO} : \text{Al}_2\text{O}_3 = 1$ by compression and annealing at 1200°C . The period of glowing for NiCr_2O_4 was 150 hours, that for NiAl_2O_4 300 hours. The specific weight of NiCr_2O_4 varied between $3,2 - 3,5 \text{ g/cm}^3$ and of NiAl_2O_4 between $1,9 - 2,2 \text{ g/cm}^3$. Radioactive iron or chromium respectively was laid on the samples by evaporation and subsequent condensation in vacuum. The diffusion took place in vacuum at 10^{-2} to 10^{-3} mm mercury column. The temperatures at which the diffusion

AUTHORS: Korobkov, I. I., Ignatov, D. V. SOV/20-120-3-25/67

TITLE: Electron Diffraction Investigation of Zirconium Dioxide Polymorphism in Thin Films (Elektronograficheskoye issledovaniye polimorfizma dvoukisl tsirkoniya v tonkikh plenkakh)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 120, Nr 3, pp.527-530 (USSR)

ABSTRACT: This investigation was conducted for the first time and was initiated on the one hand by contradictory results, on the other hand by the uncertain structure of zirconium-oxide films in the corrosion in oxidizing media. The various possible modifications of ZrO_2 were discussed by Lustman (Lastman, Ref 1). From other papers proceeds (Refs 2 - 5) that undoubtedly two forms of ZrO_2 exist: a monoclinic and a tetragonal, which interchange reversibly at from 1000 to 1100°. The authors investigated ZrO_2 films with a thickness of from 400 - 600 Å electronographically on going through. A special device permitted the observation of structural modifications of ZrO_2 in dependence on temperature and on the heating period directly in the electronograph, and that

Card 1/4

SOV/20-120-3-25/67

Electron Diffraction Investigation of Zirconium Dioxide Polymorphism in Thin Films

without cooling the sample. This device is described. These experiments showed that in the evaporation a very careful procedure must be adopted. Special attention must be paid to the vacuum in the system, as Zr reacts actively with the residual gases in melting, and produces partially oxidized films in an insufficient vacuum (10^{-5} of mercury column). The results are given as electronographs (Tables 1 and 2 and Fig 2). From the electronograph 2a for a thin Zr-layer and from the corresponding Table 1 can be seen that the values of interplanar spacing of the crystal lattice of this layer correspond to α -zirconium. They are however, greater by from 2 - 3 % in comparison to the X-ray data. The increase of the lattice constant is apparently connected with the dissolution of oxygen in the zirconium film. The analysis of the electronograph (Fig 2 and Table 2) for a zirconium film, which was heated thoroughly up to 300° , shows a complete oxidation. The diffraction pattern corresponds to the cubic modification of ZrO_2 . The value of the lattice constant of this modification $a = 5,10 \text{ \AA}$ corresponds well with the value determined by X-ray methods. (Ref 1). At a heating up to from 300 to 600° the interference rings in

Card 2/4

SOV/ 20-120-3-25/67

Electron Diffraction Investigation of Zirconium Dioxide Polymorphism in Thin Films

the electronograph become sharper and correspond to the mentioned cubic modification. From 650° upwards some of the rings begin to double, which indicates the appearance of a new ZrO_2 -modification in the layer. It shows a tetragonal lattice² (Fig 2c for 700°) It is difficult in this case to speak of the existence of two forms of ZrO_2 (a cubic and a tetragonal one) as the transition from one to another apparently takes place gradually. Between 750 and 800° lines of the monoclinic modification appear besides the lines of the tetragonal modification. They increase in intensity until at 1100° the tetragonal modification is completely displaced. The monoclinic modification is maintained up to 1300° . These transformations were observed in a vacuum, in oxygen and in air. The polymorphous transformations are therefore not the result of the oxygen dissolution or of the arrival of ZrO_2 at an exact stoichiometrical composition. There are 2 figures, 2 tables, and 6 references, 1 of which is Soviet.

Avdesiya nauk SSSR. Institut metallurgii. Nauchnyy sovet po

probleme sharochnykh splavov
Izvestiya po sharochnym splavam, t. IV (Studies on Heat-resistant Alloys. vol. 4), Moscow, Izd-vo AN SSSR, 1959. 400 p. Errata slip inserted. 2,400 copies printed.

Ed. of Publishing House: V. A. Klimov; Tech. Ed.: A. P. Guseva; Editorial Board: I. P. Kadgin, Academician; G. V. Kurdyumov, Academician; M. V. Agrest; Corresponding Member, USSR Academy of Sciences; I. A. Odintsov; I. M. Pavlov, and I. P. Zudin, Candidate of Technical Sciences.

PURPOSE: This book is intended for metallurgists concerned with the structural metallurgy of alloys.

COVERAGE: This is a collection of specialized studies of various problems in the structural metallurgy of heat-resistant alloys. Some are concerned with theoretical principles, some with descriptions of new equipment and methods, others with properties of specific materials.

Various phenomena occurring under specified conditions are studied and reported on. For details, see Table of Contents. The articles are accompanied by a number of references, both Soviet and non-Soviet.

Studies (Cont.)

Arbuzov, P. M. On the Character of Changes in the Microhardness of Structures of the Systems Mo-Si and Mo-W.

Ignatov, D. V. and N. N. Shumakova. Structural and Kinetic Investigation of the Oxidation of Nickel and Chromium and Alloys Based on Them.

343

Pedorchenko, I. M., and N. A. Filatova. Alloying of Powdered Metals by Diffusion Saturation.

346

Borovskiy, I. B. Some Results of the Application of X-ray Spectral Analysis for the Study of Micro volumes of a Substance.

352

Sornichev, A. I. Multiprecipitation Vacuum Machine for Creep and Creep-rupture Testing of Metals.

360

Berlitz, Ye. M. Device for Creep and Creep-rupture Testing of Microspecimens in Vacuum at Constant Stress.

367

Card 11/12

372

IGNATOV, Daniil Vasil'yevich

"Electron Diffraction Method for the Study of Structure and
Chemical Transformation in Thin Metal and Alloy Films"

a report presented at Symposium of the International Union of
Crystallography Leningrad, 21-27 May 1959
